Sir,

Normally how much time it takes from receipt/ acceptance of paper and publication. Is there any fast track method for papers related to COVID-19 research.

Regards

reply

**A** **Apurva Goel** 3 weeks ago

Dear Sir

The initial review of the paper takes around 10 days during which we communicate whether the paper is initially accepted or rejected, after that the the peer review process takes arnd 2 months. The time taken from the acceptance of the paper to publication is arnd 9 months.

### INSTRUCTIONS TO AUTHORS

#### Scope of the Journal

The Journal publishes original research/review papers covering almost all aspects of environment like monitoring, control and management of air, water, soil and noise pollution; solid waste management; industrial hygiene and occupational health hazards; biomedical aspects of pollution; conservation and management of resources; environmental laws and legal aspects of pollution; toxicology; radiation and recycling etc. Reports of important events, environmental news, environmental highlights and book reviews are also published in the journal.

#### Format of Manuscript

- The manuscript (*mss*) should be typed in double space leaving wide margins on both the sides.
- First page of *mss* should contain only the title of the paper, name(s) of author(s) and name and address of Organization(s) where the work has been carried out along with the affiliation of the authors.

*Continued on back inner cover...*

... Continued from inner front cover

- The text of the manuscript should run into **Abstract, Introduction, Materials & Methods, Results, Discussion, Acknowledgement** (if any) and **References** or other suitable headings in case of reviews and theoretically oriented papers. However, short communication can be submitted in running with **Abstract and References**. The references should be in full with the title of the paper.
- The figures should preferably be made on a computer with high resolution and should be capable of withstanding a reasonable reduction with the legends provided separately outside the figures. Photographs may be black and white or colour.
- Tables should be typed separately bearing a short title, preferably in vertical form. They should be of a size, which could easily be accommodated in the page of the Journal.
- References in the text should be cited by the authors' surname and year. In case of more than one reference of the same author in the same year, add suffix a,b,c,... to the year. For example: (Thomas 1969, Mass 1973a, 1973b, Madony et al. 1990, Abasi & Soni 1991).

## List of References

The references cited in the text should be arranged alphabetically by authors' surname in the following manner: (Note: The titles of the papers should be in running 'sentence case', while the titles of the books, reports, theses, journals, etc. should be in 'title case' with all words starting with CAPITAL letter.)

- Dutta, A. and Chaudhury, M. 1991. Removal of arsenic from groundwater by lime softening with powdered coal additive. J. Water Supply Res. Techno. Aqua., 40(1) : 25-29.
- Hammer, D.A. (ed.) 1989. Constructed Wetlands for Wastewater Treatment-Municipal, Industrial and Agricultural. Lewis Publishers Inc., pp. 831.
- Haynes, R. J. 1986. Surface mining and wetland reclamation. In: Harper, J. and Plass, B. (eds.) New Horizons for Mined Land Reclamation. Proceedings of a National Meeting of the American Society for Surface Reclamation, Princeton, W.V.

## Submission of Papers

- The paper can be submitted by e-mail as an attachment in a single WORD file at **contact@neptjournal.com**
- The paper can also be submitted online in a single WORD file through the journal's website: **www.neptjournal.com**

## Attention

1. Any change in the authors' affiliation may please be notified at the earliest.
2. Please make all the correspondence by e-mail, and authors should always quote the manuscript ID (number).

**Note:** In order to speed up the publication, authors are requested to send the publication charges as soon as they get the 'initial acceptance' letter, and also correct the galley proof immediately after receipt. The galley proof must be checked with utmost care, as publishers owe no responsibility for mistakes. The papers will be put on priority for publication only after receiving the processing and publication charges.

## About Us

### Aims, objectives and scope

The journal was established initially by the name of Journal of Environment and Pollution in 1994, whose name was later changed to Nature Environment and Pollution Technology in the year 2002. It has now become an open access online journal from the year 2017 with ISSN: 2395-3454 (Online).

The journal was established especially to promote the cause for environment and to cater the need for rapid dissemination of the vast scientific and technological data generated in this field. It is a part of many reputed international indexing and abstracting agencies.

The Journal has evoked a highly encouraging response among the researchers, scientists and technocrats. It has a reputed International Editorial Board and publishes peer reviewed papers.

The journal publishes both original research and review papers. The ideology and scope of the Journal includes the following.

- Monitoring, control and management of air, water, soil and noise pollution
- Solid waste management
- Industrial hygiene and occupational health
- Biomedical aspects of pollution
- Toxicological studies
- Radioactive pollution and radiation effects
- Wastewater treatment and recycling etc.
- Environmental modelling
- Biodiversity and conservation
- Dynamics and behaviour of chemicals in environment
- Natural resources, wildlife, forests and wetlands etc.
- Environmental laws and legal aspects
- Environmental economics
- Any other topic related to environment

### Frequency of the journal

The Journal is published quarterly in the months of March, June, September and December every year.

### Editorial and Peer Review Process

When a manuscript is submitted to the journal, it is initially inspected for its subject relevance, linguistics and quality, and is primarily accepted for consideration for publication or rejected based on these criteria. Once it is considered for publication, it is given a manuscript number and sent to an expert external reviewer for external review. Based on the comments received from the reviewer, the manuscript gets revised for publication from the authors or rejected. However, the final decision of rejection, modification and acceptance of the manuscript rests with the main editors. A single-blind review process, where authors' identities are known to the reviewers is followed by the journal.

### Copyright and License

- Technoscience Publications follows the CC BY license ([Creative Commons Attribution v4.0 International License](#)) for its open access journal 'Nature Environment and Pollution Technology'.
- The CC BY license is the most open license available and considered the industry 'gold standard' for open access.
- This license allows users to copy and redistribute the material in any medium or format, and to alter, transform, or build upon the material, including for commercial use, provided that the original author is credited.
- Copyright on any open access article in the journal 'Nature Environment and Pollution Technology' published by Technoscience Publications is retained by the author(s).
- Authors grant Technoscience Publications a license to publish the article and identify itself as the original publisher.

### Plagiarism policy

Plagiarism is a practice where the authors try to publish someone else's work as their own. Self-plagiarism is also practised when an author tries to re-publish his previously published articles/data in some other journal.

NEPT journal accesses the submitted manuscript for any plagiarism and takes immediate action against it. If more than 25% of the article is plagiarized, it is rejected straight away. If less than 25% is plagiarized, the authors are asked to revise the article giving the appropriate references wherever required.

### Open Access Statement of the Journal

This is an open access journal which means that all the content is freely available without charge to the user or his/her institution. Users are allowed to read, download, copy, distribute, print, search, or link to the full texts of the articles, or use them for any other lawful purpose, without asking prior permission from the publisher or the author. This is in accordance with the BOAI definition of open access.

Ammonia  
Gorontalo Bay  
Chlorophyll- $\alpha$  distribution  
Nitrate  
Phosphate

## ABSTRACT

The concentration of chlorophyll- $\alpha$  in the Gorontalo Bay is necessary to be observed since it could describe the condition of water richness. The semi-enclosed Gorontalo Bay morphology causes the status of water fertility to be largely determined by the input of inorganic or organic materials originating from the mainland. This study aimed to figure out the concentration and horizontal distribution pattern of the chlorophyll- $\alpha$  then further to decide the relationship between the concentration of chlorophyll- $\alpha$  and the nutrients in the Gorontalo Bay. There were fifteen sub-sampling sites selected based on coastal and ecological characteristics. Results showed that the distribution pattern of chlorophyll- $\alpha$  in the Gorontalo Bay in June and July 2017 was dissimilar and its concentration ranged from 0.984 to 3.744 mg.m<sup>-3</sup>. In addition, there was a positive and substantial relationship between chlorophyll- $\alpha$  and phosphate ( $p < 0.01$ ). Nonetheless, there was no significant correlation between chlorophyll- $\alpha$  and nitrate ( $p > 0.01$ ) and ammonia ( $p > 0.01$ ).

## INTRODUCTION

Bay ecosystem is very dynamic because of the influence of the mainland and human impacts (Madin et al. 2016, Österblom et al. 2017). Physical, chemical, and biological conditions depend on inputs which are derived from land activities. Ecosystem balance and sustainability of aquatic biota of bay become an essential aspect that must be maintained. Water fertility is one point that contributes greatly in ensuring the balance of the marine ecosystem. The distribution of chlorophyll- $\alpha$  on the water surface is an indicator which can be used to estimate water fertility.

Geographically Gorontalo Bay is a part of Tomini Bay, morphologically Gorontalo Bay is semi-enclosed waters then likely that the profile of surface chlorophyll- $\alpha$  distribution in these waters is local in type and different from the distribution of chlorophyll- $\alpha$  in Tomini Bay. The two main points that underlie the importance of studying the distribution of chlorophyll- $\alpha$  in the Gorontalo Bay are ecological and economic roles. Ecologically, the Gorontalo Bay is still semi-encircled waters to enable inputs from terrestrial activities that carry organic or inorganic materials which are very decisive for water fertility. Human activities in the mainland around the waters of Gorontalo Bay are relatively varied. Output and waste from human activities containing organic or inorganic materials flow into the waters through rivers and streams during rain (Cloern et al. 2016).

Gorontalo Bay has an economical purpose as this bay is a strategic zone for fishing by local fishermen. Local people whose main livelihoods are fishermen depend mainly on catches. The availability of the abundant and varied fish of the bay is meanderingly influenced by the availability of diet. Phytoplankton, the autotrophic part of the plankton community, is a key element in oceanic ecosystems and in biogeochemical cycling (Beltran-Heredia et al. 2017). The presence of it as the food of fish is determined by the water fertility aspect that can be reflected from the distribution of chlorophyll- $\alpha$ .

The purpose of this study was to determine the concentration and horizontal distribution pattern of chlorophyll- $\alpha$  and to figure out the correlation between chlorophyll- $\alpha$  and nutrient concentrations in the Gorontalo Bay.

## MATERIALS AND METHODS

Water samples were carried out twice in June and July 2019 and collected from five different stations of land use. In the mainland near the site 1, there are rare resident settlements; near, from site 2 there are no human activities yet because of a steep cliff presence. Moreover, land use near the site 3 is Bone River estuary. In the site 4 there is an oil port and in the site 5 there are densely populated settlements. Sampling at each station was performed out on 3 sub-stations by dragging the line-transect to the offshore as presented on the sampling map on the Fig. 1.

The samples for analysis of chlorophyll- $\alpha$  and nutrient concentration were collected from fifteen different points then compiled into five sample bottles and taken at Hydrobiology Laboratory, Environment and Waters Biotechnology division, Universitas Brawijaya. Analysis of water samples was made referring to APHA standard procedures (APHA 1989). The water samples were collected in the column water horizontally by using plankton net (Tuney & Maroulakis 2014). The net was held by the side of the boat (while the boat was moving slowly) for approximately 1.5 minutes. A slight turn performed with the boat so that the net was towed from the inner side of the turn to avoid drifting the net under the boat.

The pigment form (chlorophyll- $\alpha$ ) concentration was estimated by using spectrophotometer (Rice et al. 2014). The absorbance at 664 nm was used to determine the chlorophyll- $\alpha$  concentration in the extract through the calculation by inserting the corrected optical densities in the following equations:

$$\text{Chlorophyll-}\alpha \text{ (mg.m}^{-3}\text{)} = 11.85 (\text{absorbance } 664 \text{ nm}) - 1.54 (\text{absorbance } 674 \text{ nm}) - 0.08 (\text{absorbance } 630 \text{ nm}) \quad \dots(1)$$

Where, absorbance 664, 647 and 630 nm = corrected optical densities (with a 1cm light path) at the wavelength.

After determining the concentration of the pigment extract, the amount of pigment per unit volume was calculated as follows:

$$\text{Chlorophyll-}\alpha \text{ (mg.m}^{-3}\text{)} = \frac{\text{Chlorophyll-}\alpha \text{ (mg.L}^{-1}\text{)} \times \text{extract volume (L)}}{\text{Volume of sample (m}^3\text{)}} \quad \dots(2)$$

## DATA ANALYSIS

Data were analysed by statistical software SPSS and Microsoft Office Excel 2010. Data were subjected to correlate and bi-variety test to find significant relationship between chlorophyll- $\alpha$  and nutrient concentration, while *t*-test to find significant distinction between nutrients concentration during sampling ( $p < 0.05$ ) considered being significantly different. In addition, the distribution of chlorophyll- $\alpha$  concentrations were visualized by ArcGIS version 10 software with spatial interpolation technique.

## RESULTS AND DISCUSSION

### Concentration and Distribution of Chlorophyll- $\alpha$ in the Gorontalo Bay

The concentration of chlorophyll- $\alpha$  among the five stations was varied from 0.984 to 3.740 mg.m<sup>-3</sup> during the two sampling times, June and July (Fig. 2). Averagely, the concentration of chlorophyll- $\alpha$  recorded during sampling was higher in July than that in June. Furthermore, the value of chlorophyll- $\alpha$  in the station 4 in July was the highest with the number of 3.744 mg.m<sup>-3</sup>, on the other hand the lowest concentration was in the station 5 in June with the chlorophyll of 0.984 mg.m<sup>-3</sup>.

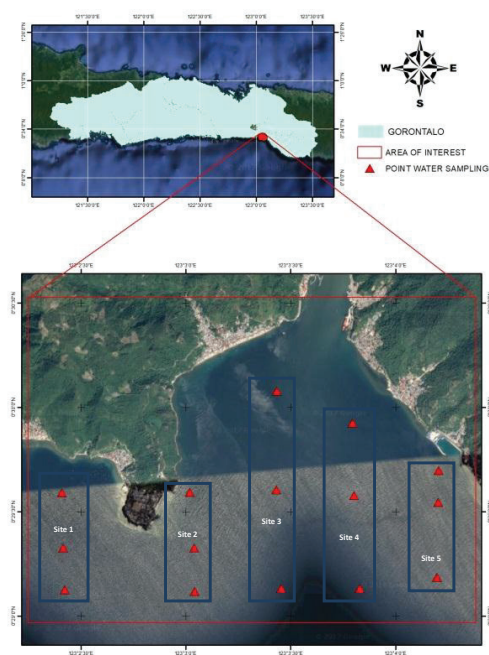

Fig.1: Sampling sites in the Gorontalo Bay.

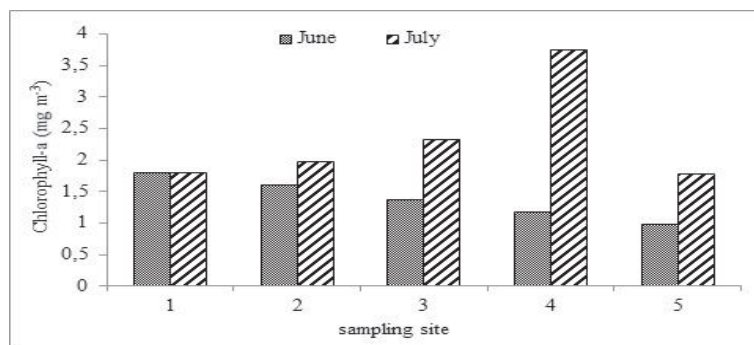

Fig. 2: Chlorophyll- $\alpha$  in the Gorontalo Bay at five sampling sites between June and July ( $p < 0.05$ ).

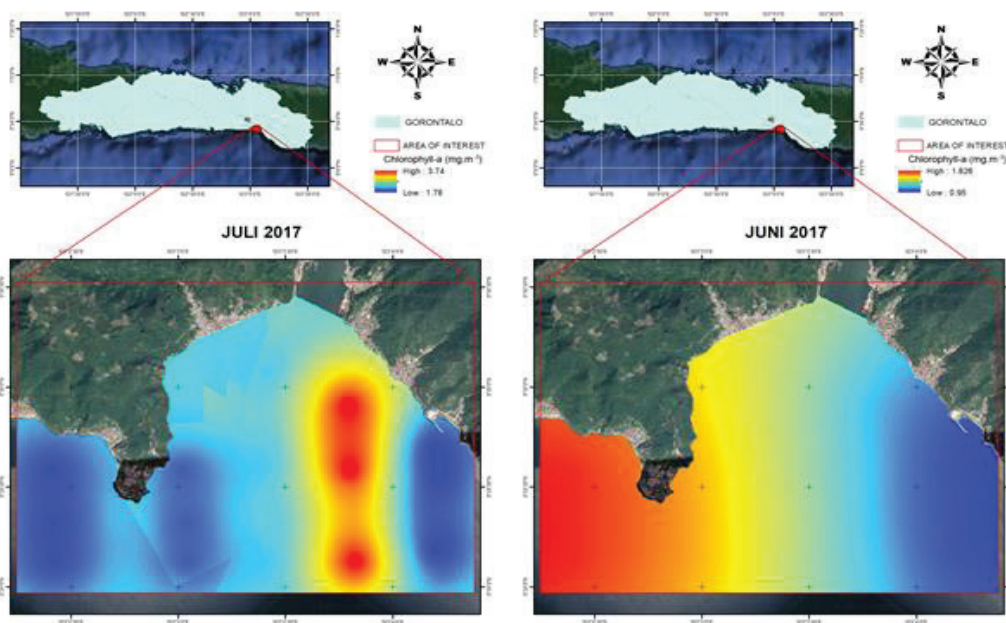

Fig. 3: Horizontal distribution of chlorophyll- $\alpha$  in the Gorontalo Bay in June and July 2017.

The chlorophyll- $\alpha$  surface concentration in the Gorontalo Bay in June was higher than that of chlorophyll- $\alpha$  in July. This is because a day before the sampling in July there was rain, therefore the inorganic materials that are the source of food for phytoplankton came in the bay waters through run-off. It is generally accepted that phytoplankton biomass can be reflected by concentration of chlorophyll- $\alpha$  (Larsson et al. 2017).

Being the predominant pigment in phytoplankton cells, chlorophyll- $\alpha$  has been long used as a proxy for estimating the standing stocks of phytoplankton biomass in the water column. The latter is of major importance, as phytoplank-

ton plays a central role in the structure and functioning of aquatic ecosystems, while its abundance reflects the trophic state of a water body (Mandalakis et al. 2017). Moreover, Fig. 3 depicts that chlorophyll- $\alpha$  in June 2017 was different from that of July 2017.

Based on the visualization results of horizontal distribution of chlorophyll- $\alpha$  (Fig. 3), it showed that the chlorophyll- $\alpha$  distributed highly in the western area of the bay in June 2017 and in the eastward revealed low concentration. Furthermore, different trend was shown in July 2017 as there was a change in the horizontal distribution pattern of chlorophyll- $\alpha$ . In July the eastern part of the waters has

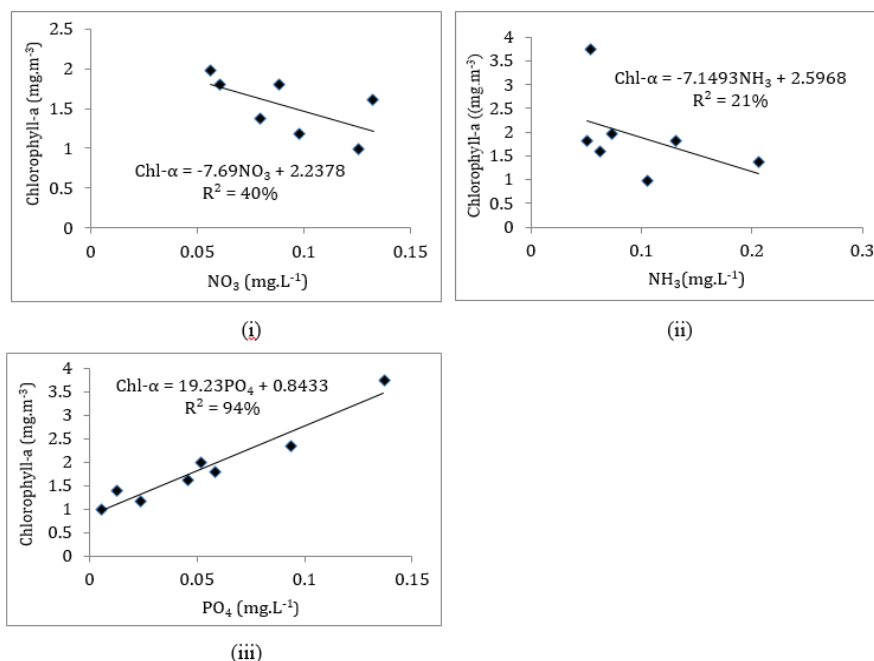

Fig. 4: Simple correlation between chlorophyll- $\alpha$  and (i) NO<sub>3</sub> (ii) NH<sub>3</sub> and PO<sub>4</sub> (iii) concentration in the Gorontalo Bay.

a high concentration of chlorophyll- $\alpha$ , while in the west it has low chlorophyll- $\alpha$  value. This fact indirectly indicates that the trophic status on the west and east parts of Gorontalo Bay in these two months is altered.

The main factor suspected to cause this spreading pattern distribution is a seasonal reversing wind season. Local fishermen informed that in June 2017, it was the end of wet season where the local wind moves from eastward to westward. Otherwise, in July it was the east wind season where the wind blows from westward to eastward. Allahdadi et al. (2017) identified that coastal current and its spatial distribution were significantly affected by open boundary conditions. Wind controls the movement of water in semi-enclosed bay of large shallow Lake Taihu, China (Li et al. 2017). The movement of wind causes a water mass transfer in the semi-enclosed Gorontalo Bay which has chlorophyll- $\alpha$ .

#### Relationship Between Chlorophyll- $\alpha$ and Nutrient Concentrations in the Gorontalo Bay

The concentrations of ammonia, nitrate and phosphate in the waters of Gorontalo Bay in June and July of 2017 were relatively different. In the Gulf of Gorontalo in June and July, the ammonia concentration was  $0.116 \pm 0.213 \text{ mg.m}^{-3}$  with the least value of  $0.035 \text{ mg.m}^{-3}$  and the greatest value of  $0.336 \text{ mg.m}^{-3}$ . Nitrate concentration was  $0.091 \pm 0.074 \text{ mg.m}^{-3}$  with the lowest value of  $0.042 \text{ mg.m}^{-3}$  and the highest of  $0.146 \text{ mg.m}^{-3}$ . The concentration of phosphate

was  $0.047 \pm 0.095 \text{ mg.m}^{-3}$  with the lowest concentration of  $0.003 \text{ mg.m}^{-3}$  and the highest of  $0.137 \text{ mg.m}^{-3}$ . Phosphate concentrations in waters are lower than nitrogen (ammonia and nitrate). This is because the phosphorus has been considered a key limiting nutrient in marine systems (Redfield 1958).

The relationship between chlorophyll- $\alpha$  concentration with nutrients, ammonia, nitrate, and phosphate is presented in Fig. 4. It can be seen from the figure that there is a negative correlation between chlorophyll- $\alpha$  and ammonia and nitrate. Although based on *t*-test results the data showed no significant correlation of chlorophyll- $\alpha$  concentrations to ammonia and nitrate. The determination coefficient between chlorophyll- $\alpha$  and ammonia and nitrate was 40% and 21% respectively. Balali et al. (2013) stated that there is a significant negative correlation between chlorophyll- $\alpha$  and nitrate ( $R^2 = 26.1\%$ ) and ammonia ( $R^2 = 11\%$ ) as the amount of chlorophyll- $\alpha$  was high when the amounts of nitrate and ammonia were the lowest.

Otherwise, a positive correlation is indicated by the relationship between chlorophyll- $\alpha$  concentration and phosphate concentration in the waters of the Gorontalo Bay with a coefficient of determination of 94%. Furthermore, there is a positive correlation between chlorophyll- $\alpha$  and phosphate in the waters (Magumba et al. 2013, Hakanson & Eklund 2010, Davis & Cornwell 1991).

## CONCLUSIONS

There was a positive and significant relationship between chlorophyll- $\alpha$  and phosphate ( $p < 0.01$ ) but no significant correlation between chlorophyll- $\alpha$  and nitrate ( $p > 0.01$ ) and ammonia ( $p > 0.01$ ) in the Gorontalo Bay in June and July 2017. In addition, the chlorophyll- $\alpha$  concentration in the Gorontalo Bay in June and July 2017 ranged from 0.984 to 3.744  $\text{mg}\cdot\text{m}^{-3}$ .
