Abstract: This study aimed to describe the practicality of physics learning devices with guided inquiry learning models using google site media. This research was conducted at SMA Negeri 1 Tilango, and the research sample was class XI IPA 1 using a simple random sampling technique. This development research uses Research and Development (R&D) research using the ADDIE development model developed by Reiser and Mullenda, which consists of the Analysis, Design, Development, Implementation, and Evaluation stages. The practicality test is carried out at the implementation stage. The results showed that the guided inquiry learning model with google sites media on static fluid material was very well used in the learning process, with an average percentage of learning implementation of 91.2%, an average student response of 83.6%, and an average response of teachers by 92.03%.

Keywords: Google sites; Guided inquiry; Learning device; Static fluid.

Introduction

Education is an organized communication designed to develop learning activities for learners or students. In education, a trendy term is known, namely the teaching and learning or learning process. Learning is an attempt to direct students into the learning process to obtain learning objectives following what is expected (Payu et al., 2023; Amali et al., 2023; Hermanto et al., 2023; Djou et al., 2022).

The education curriculum, especially in Indonesia, is multiplying. The curriculum in Indonesia constantly changes according to the times, science and technology, students' intelligence level, and society's needs. Based on the revised 2013 curriculum, education aims to prepare Indonesian people to have the ability to live as individuals and citizens who are faithful, productive, creative, innovative, effective, and able to contribute to the life of society, nation, state, and world

civilization. For this to be achieved, it is necessary to implement the 2013 curriculum education program as a reference in carrying out learning in schools. Physics is one of the fundamental sciences that deal with nature, behavior, and the structure of things (Ntobuo et al., 2023; Abdjul et al., 2022). Physics is a branch of natural science that does not only contain theory and formulas that must be memorized, but physics requires an understanding and understanding of concepts that are focused on the process of forming knowledge through the discovery and presentation of data (I Ketut Mahardika et al., 2021: 231). Quality learning requires learning tools that can support students in understanding and mastering the material well (Gunada et al., 2015; Bokingo et al., 2022).

The teacher arranges learning tools so that the implementation of learning goes well according to what was previously planned. It makes students more motivated to learn and makes it easier for students to understand the material presented by the teacher

Example: Supartin, Buhungo, T. J., Arbie, A., Sanjaya, F., & Demulawa, M. (2023). Practicality of guided inquiry learning devices using google sites media on static fluid materials. *Jurnal Penelitian Pendidikan IPA*, 1(1), 1-4. <https://doi.org/10.29303/jppipa.v1i1.264>

(Saputri et al., 2022; Pakaya et al., 2022). The learning tools usually developed are syllabi, lesson plans, worksheets, teaching materials, learning media, and assessment tests (Sahidu, 2019).

Based on the results of interviews and observations of physics teachers at Tilango 1 Public High School, they have used learning tools guided by the 2013 curriculum, which consists of a syllabus, lesson plans, teaching materials, LKPD, learning media, and evaluation instruments. Nevertheless, in its application, learning still runs in one direction or is only centered on the teacher's need for more innovative use of learning models. Teachers tend to use the lecture method to make students more likely to be passive. In addition, the need for more innovation in the use of learning media is not optimal, especially the use of learning media that utilizes technology. This causes a lack of interest in students, and students need to understand the physics concepts being taught. This can be seen from the percentage of students who get scores above the KKM of only 30%.

There needs to be innovation in learning physics to improve the learning process in Responding to these problems. One effort to overcome this is to develop learning tools. Learning devices are a collection of tools teachers and students use in the learning process so that the teaching and learning process can run smoothly, efficiently, and effectively (Trianto, 2018; Linggile et al., 2022). The learning process can run effectively and is heavily influenced by learning tools, so it is necessary to develop learning tools. An appropriate learning model is needed to encourage students to learn actively. To support this, one model that emphasizes student activity is the guided inquiry model (Suhartini et al., 2016; Alik et al., 2023).

The guided inquiry learning model is a learning model that directs students to find answers to the problems raised by the teacher (Amam., 2015). The advantage of the guided inquiry model, according to (Sarwi et al., 2016), namely the observation process can create exciting and fun learning conditions so that students are more motivated to learn. The selection of the guided inquiry learning model is supported by research results (Hermansyah et al., 2017; Supartin et al., 2022), which show that guided inquiry learning affects mastery of concepts. Along with the development of information technology, it is necessary to use technology as a medium that supports the learning process, one of which is the use of Google sites media. Google sites are products made by Google to create personal or group sites equipped with features that can support the learning process (Taufik, 2018). Based on the description above, the purpose of this study was to describe the practicality of the physics

learning device with the guided inquiry model using Google's sites media.

Method

This research is included in Research and Development R&D research, namely development-type research that focuses on describing the level of practicality of physics learning devices using the guided inquiry model using Google sites media. This study uses the ADDIE model development, which consists of the analysis, design, development, implementation, and evaluation stages.

Practicality test Learning tools are carried out at the implementation stage to see the level of practicality of learning using the developed learning tools. It will be implemented in class XI IPA of SMA Negeri 1 Tilango in the odd semester of the Academic Year 2022/2023 in determining research subjects using a simple random sampling technique. The practicality of learning devices is seen from the observation of the implementation of learning and the responses of teachers and students to the learning tools that have been developed. The instrument used to collect data is the observation sheet of learning implementation based on the lesson plan at each meeting. The assessment on the learning implementation sheet consists of two options: implemented and not implemented. Assessment of the implementation of learning is done by trying the results of the average total score given with the following criteria in Table 1 (Purnomo, 2014:92).

Table 1. Learning Implementation Criteria

Value	Criteria
81%-100%	Very good
61%-80%	Good
41%-60%	Enough
21%-40%	Not good

The practicality of learning is also seen by giving questionnaires to the responses of teachers and students to learn using the developed tools. In this study, the response questionnaire instrument used a Likert scale with respondents giving scores of 1 (strongly disagree), 2 (disagree), 3 (doubtful), 4 (agree), and 5 (strongly agree).

Result and Discussion

The practicality of the developed learning tools can be seen from the implementation sheets following the guidelines or steps of learning activities contained in

the lesson plan and questionnaire responses of teachers and students.

Results

The practicality of the learning tools developed can be seen from the implementation sheet, which follows the steps of the learning activities contained in the lesson plans for three meetings. The percentage data from the learning implementation sheet can be seen in Table 2. Table 2 shows that the three meetings' learning implementation percentage reached very good criteria. It can be seen that the implementation of learning from the first to the third meeting has an overall average score of 91.2% and obtains very good criteria according to (Purnomo, 2014: 92).

Table 2. Results of Implementation of Learning

Meeting	Percentage of Implementation (%)	Criteria
1.	91.6	Very good
2.	100	Very good
3.	100	Very good
Average	91.2	Very good

The practicality of the developed learning tools was also seen from the teacher and student response questionnaires. The teacher's response questionnaire was given after the learning process for three meetings to see the teacher's response to the learning tools used. The teacher response questionnaire can be seen in Table 3.

Table 3. Teacher Response Questionnaire Results

Indicator	Strongly agree	Agree	Doubtful	Disagree	Strongly Disagree
Syllabus	50	50	0	0	0
RPP	37.14	62.86	0	0	0
LKPD	71.42	28.57	0	0	0
Teaching materials	58.33	41.67	0	0	0
Media	63.64	36.36	0	0	0
THB	52.63	47.37	0	0	0
Average	55.52	44.48	0	0	0

Based on Table 3, the teacher's response questionnaire results show that the teacher's response to the six learning device assessment indicators reached 55.52% strongly agree, and 44.48% agreed on all components of the learning device developed. This shows that the response of

the physics teacher to the learning tools developed has met the applicable criteria for use in learning.

After the learning process, student response questionnaire sheets were given for three meetings to see student responses to the learning tools developed. The results of student response data are presented in Table 4.

Table 4. Student Response Questionnaire Results

Indicator	Strongly agree	Agree	Doubtful	Disagree	Strongly Disagree
Syllabus	20.8	68.8	10.4	0	0
RPP	21.33	70.66	8	0	0
LKPD	26.66	64	9.33	0	0
Teaching materials	29.33	54.66	16	0	0
Media	22.66	57.33	20	0	0
THB	51.2	68.8	10.4	0	0
Average	25.04	64.04	12.35	0	0

Based on Table 4 shows that the learning tools developed meet the requirements for use in the learning process, with an average response of students reaching 25.04% strongly agree, 64.04%, and 12.35% respond hesitantly.

Discussion

The practicality of learning tools can be seen from: (1) the implementation of learning; (2) teacher

and student response questionnaires. One observer observed the implementation of learning for three meetings. Based on the results of observations made by observers of the learning carried out by the teacher that the implementation of learning following the learning stages written in the lesson plan for the first meeting, namely 91.6%; this was because the teacher did not carry out the two steps of the activities listed in the lesson plan. At the second meeting, it was 100%

implemented, and in the third meeting was 100%, so the average percentage of learning implementation was 91.2%, thus obtaining a very good and practical title to be implemented in the learning process. This is in line with research conducted by (Benda, Dewi & Trisnawaty, 2022), which states that the implementation of learning by conformity with the steps contained in lesson plans obtains an average percentage of implementation of learning for three meetings of 98.33%. Get the title of very good and practical to be implemented in learning.

The practicality of learning devices is also reviewed from the response of teachers and students. The teacher's response questionnaire consisting of 6 indicators consisting of 116 statements showed that, on average, teachers agreed to implement the guided inquiry learning model using Google sites media. At the same time, the student questionnaire showed that most students agreed to implement the guided inquiry learning model using Google sites media. Thus, seen from the results of the average percentage of teacher and student response questionnaires to learning tools developed in practical categories can be applied in the learning process. This aligns with research conducted (Chairunnisa, 2022) that practical learning tools can help teachers implement the learning process. This research is also supported by (Sabrina, 2019), which shows that using google sites-based learning media is an innovative and interactive learning media creation in learning.

Conclusion

Based on the research and discussion results, the guided inquiry learning device using google sites media on static fluid material is practical to implement in physics learning. Some things that can be used in suggestions for further improvement, namely for future researchers to develop learning tools in other physics materials.

understand the material presented by the teacher (Saputri et al., 2022; Pakaya et al., 2022). The learning tools usually developed are syllabi, lesson plans, worksheets, teaching materials, learning media, and assessment tests (Sahidu, 2019).

Based on the results of interviews and observations of physics teachers at Tilango 1 Public High School, they have used learning tools guided by the 2013 curriculum, which consists of a syllabus, lesson plans, teaching materials, **LKPD**, learning media, and evaluation instruments. Nevertheless, in its application, learning still runs in one direction or is only centered on the teacher's need for more innovative use of learning models. Teachers tend to use the lecture method to make students more likely to be passive. In addition, the need for more innovation in the use of learning media is not optimal, especially the use of learning media that utilizes technology. This causes a lack of interest in students, and students need to understand the physics concepts being taught. This can be seen from the percentage of students who get scores above the **KKM** of only 30%.

There needs to be innovation in learning physics to improve the learning process in Responding to these problems. One effort to overcome this is to develop learning tools. Learning devices are a collection of tools teachers and students use in the learning process so that the teaching and learning process can run smoothly, efficiently, and effectively (Trianto, 2018; Linggile et al., 2022). The learning process can run effectively and is heavily influenced by learning tools, so it is necessary to develop learning tools. An appropriate learning model is needed to encourage students to learn actively. To support this, one model that emphasizes student activity is the guided inquiry model (Suhartini et al., 2016; Alik et al., 2023).

The guided inquiry learning model is a learning model that directs students to find answers to the problems raised by the teacher (Amam., 2015). The advantage of the guided inquiry model, according to (Sarwi et al., 2016), namely the observation process can create exciting and fun learning conditions so that students are more motivated to learn. The selection of the guided inquiry learning model is supported by research results (Hermansyah et al., 2017; Supartin et al., 2022), which show that guided inquiry learning affects mastery of concepts. Along with the development of information technology, it is necessary to use technology as a medium that supports the learning process, one of which is the use of Google sites media. Google sites are products made by Google to create personal or group sites equipped with features that can support the learning process (Taufik, 2018). Based on the description above, the purpose of this study was to describe the practicality of the physics

learning device with the guided inquiry model using Google's sites media.

Method

This research is included in Research and Development R&D research, namely development-type research that focuses on describing the level of practicality of physics learning devices using the guided inquiry model using Google sites media. This study uses the ADDIE model development, which consists of the analysis, design, development, implementation, and evaluation stages.

Practicality test Learning tools are carried out at the implementation stage to see the level of practicality of learning using the developed learning tools. It will be implemented in class XI IPA of SMA Negeri 1 Tilango in the odd semester of the Academic Year 2022/2023 in determining research subjects using a simple random sampling technique. The practicality of learning devices is seen from the observation of the implementation of learning and the responses of teachers and students to the learning tools that have been developed. The instrument used to collect data is the observation sheet of learning implementation based on the lesson plan at each meeting. The assessment on the learning implementation sheet consists of two options: implemented and not implemented. Assessment of the implementation of learning is done by trying the results of the average total score given with the following criteria in Table 1 (Pumomo, 2014:92).

Table 1. Learning Implementation Criteria

Value (%)	Criteria
81%-100%	Very good
61%-80%	Good
41%-60%	Enough
21%-40%	Not good

The practicality of learning is also seen by giving questionnaires to the responses of teachers and students to learn using the developed tools. In this study, the response questionnaire instrument used a Likert scale with respondents giving scores of 1 (strongly disagree), 2 (disagree), 3 (doubtful), 4 (agree), and 5 (strongly agree).

Result and Discussion

the lesson plan and questionnaire responses of teachers and students.

Results

The practicality of the learning tools developed can be seen from the implementation sheet, which follows the steps of the learning activities contained in the lesson plans for three meetings. The percentage data from the learning implementation sheet can be seen in Table 2. Table 2 shows that the three meetings' learning implementation percentage reached very good criteria. It can be seen that the implementation of learning from the first to the third meeting has an overall average score of 91.2% and obtains very good criteria according to (Purnomo, 2014: 92).

The practicality of the developed learning tools was also seen from the teacher and student response questionnaires. The teacher's response questionnaire was given after the learning process for three meetings to see the teacher's response to the learning tools used. The teacher response questionnaire can be seen in Table 3.

Table 2. Results of Implementation of Learning

Meeting	Percentage of Implementation (%)	Criteria
1.	91.6	Very good
2.	100	Very good
3.	100	Very good
Average	91.2	Very good

Table 3. Teacher Response Questionnaire Results

Indicator	Strongly agree	Agree	Doubtful	Disagree	Strongly Disagree
Syllabus	50	50	0	0	0
RPP	37.14	62.86	0	0	0
LKPD	71.42	28.57	0	0	0
Teaching materials	58.33	41.67	0	0	0
Media	63.64	36.36	0	0	0
THB	52.63	47.37	0	0	0
Average	55.52	44.48	0	0	0

Based on Table 3, the teacher's response questionnaire results show that the teacher's response to the six learning device assessment indicators reached 55.52% strongly agree, and 44.48% agreed on all components of the learning device developed. This shows that the response of

the physics teacher to the learning tools developed has met the applicable criteria for use in learning.

After the learning process, student response questionnaire sheets were given for three meetings to see student responses to the learning tools developed. The results of student response data are presented in Table 4.

Table 4. Student Response Questionnaire Results

Indicator	Strongly agree	Agree	Doubtful	Disagree	Strongly Disagree
Syllabus	20.8	68.8	10.4	0	0
RPP	21.33	70.66	8	0	0
LKPD	26.66	64	9.33	0	0
Teaching materials	29.33	54.66	16	0	0
Media	22.66	57.33	20	0	0
THB	51.2	68.8	10.4	0	0
Average	25.04	64.04	12.35	0	0

Based on Table 4 shows that the learning tools developed meet the requirements for use in the learning process, with an average response of students reaching 25.04% strongly agree, 64.04%, and 12.35% respond hesitantly.

Discussion

The practicality of learning tools can be seen from: (1) the implementation of learning; (2) teacher

and student response questionnaires. One observer observed the implementation of learning for three meetings. Based on the results of observations made by observers of the learning carried out by the teacher that the implementation of learning following the learning stages written in the lesson plan for the first meeting, namely 91.6%; this was because the teacher did not carry out the two steps of the activities listed in the lesson plan. At the second meeting, it was 100%

Commented [HC8]: Yang masih berupa singkatan diinggriskan kepanjangannya

Commented [AD9]: In english?

Commented [AD10]: In english

Commented [HC11]: Tidak bold

implemented, and in the third meeting was 100%, so the average percentage of learning implementation was 91.2%, thus obtaining a very good and practical title to be implemented in the learning process. This is in line with research conducted by (Benda, Dewi & Trisnawaty, 2022), which states that the implementation of learning by conformity with the steps contained in lesson plans obtains an average percentage of implementation of learning for three meetings of 98.33%. Get the title of very good and practical to be implemented in learning.

The practicality of learning devices is also reviewed from the response of teachers and students. The teacher's response questionnaire consisting of 6 indicators consisting of 116 statements showed that, on average, teachers agreed to implement the guided inquiry learning model using Google sites media. At the same time, the student questionnaire showed that most students agreed to implement the guided inquiry learning model using Google sites media. Thus, seen from the results of the average percentage of teacher and student response questionnaires to learning tools developed in practical categories can be applied in the learning process. This aligns with research conducted (Chairunnisa, 2022) that practical learning tools can help teachers implement the learning process. This research is also supported by (Sabrina, 2019), which shows that using google sites-based learning media is an innovative and interactive learning media creation in learning.

Conclusion

Based on the research and discussion results, the guided inquiry learning device using google sites media on static fluid material is practical to implement in physics learning. Some things that can be used in suggestions for further improvement, namely for future researchers to develop learning tools in other physics materials.

Abstract: This study aimed to describe the practicality of physics learning devices with guided inquiry learning models using google site media. This research was conducted at SMAN 1 Tilango, and the study sample was class XI IPA 1, using a simple random sampling technique. This development study uses research and development research (R&D) using the developed ADDIE development model, which consists of analysis, design, development, implementation, and evaluation phases. The practicality test is carried out at the implementation stage. The results showed that the guided inquiry learning model with google sites media on static fluid material was very well used in the learning process, with an average percentage of learning implementation of 91.2%, an average student response of 83.6%, and an average response of teachers by 92.03%.

Keywords: Google sites; Guided inquiry; Learning device; Static fluid.

Introduction

Education is an organized communication designed to develop learning activities for learners or students. In education, a trendy term is known, namely the teaching and learning or learning process. Learning is an attempt to guide the student through the learning process to obtain learning objectives following what is expected (Payu et al., 2023; Amali et al., 2023; Hermanto et al., 2023; Djou et al., 2022).

The education curriculum, especially in Indonesia, is multiplying. The curriculum in Indonesia constantly changes according to the times, science and technology, students' intelligence level, and society's needs. Based on the revised 2013 curriculum, education enables Indonesian people to be loyal, productive, innovative, creative, and effective. Contributing to society, nation, nation and national life. It is intended to prepare you for life as an individual and citizen. A

country that contributes to world civilization. For this to be achieved, the 2013 Curriculum Education Program should be a reference for classroom learning implementation. Physics is one of the basic sciences dealing with nature, behavior, and the structure of things (Ntobuo et al., 2023; Abdjul et al., 2022). Physics is a branch of science that requires not only theories and formulas that need to be memorized but also understanding and comprehension of concepts that focus on knowledge formation through the discovery and presentation of data. (Mahardika et al., 2021). Quality learning requires learning tools that can support students in understanding and mastering the material well (Gunada et al., 2015; Bokingo et al., 2022).

The teacher arranges learning tools so that the implementation of learning goes well according to what was previously planned. It motivates students to learn and makes understanding the material the teacher presents easier (Saputri et al., 2022; Pakaya et

Proofread

al., 2022). The learning tools usually developed are syllabi, teaching materials, worksheets, learning media, lesson plans, and assessment tests (Sahidu, 2019; Buhungo et al., 2023).

Based on activities about interviews and observations with teachers at SMAN 1 Tilango, especially physics teachers, they have used learning tools guided by the 2013 curriculum, which consists of a syllabus, student worksheets, lesson plans, teaching materials, learning media, and evaluation instruments. Nevertheless, in its application, learning still runs in one direction or is only centered on the teacher's need for more innovative use of learning models. Teachers tend to use the lecture method to make students more likely to be passive. In addition, the need for further innovation in the use of learning media is suboptimal, especially the use of learning media that utilizes technology. This causes a lack of interest in students, and students need to understand the physics concepts being taught. This is evident when looking at the student population who get scores above the minimum completeness criteria of only 30%.

There needs to be innovation in learning physics to improve the learning process in Responding to these problems. One effort to overcome this is to develop learning tools. Learning devices are a collection of tools teachers and students use in the learning process so that the teaching and learning process can run smoothly, efficiently, and effectively (Trianto, 2018; Linggile et al., 2022). The learning process can run effectively and is heavily influenced by learning tools, so it is necessary to develop learning tools. An appropriate learning model is needed to encourage students to learn actively. To support this, one model that emphasizes student activity is the guided inquiry model (Suhartini et al., 2016; Alik et al., 2023).

The guided inquiry learning model is a learning model that shows students to find answers to problems posed by teachers (Amam, 2015). The advantage of the guided inquiry model, according to (Sarwi et al., 2016; Setiawan et al., 2023), namely the observation process can create exciting and fun learning conditions so that students are more motivated to learn. The selection of the guided inquiry learning model is supported by research results (Hermansyah et al., 2017; Supartin et al., 2022), which show that guided inquiry learning affects mastery of concepts. Along with the development of information technology, it is necessary to use technology as a medium that supports the learning process, one of which is the use of Google sites media. Google sites are products made by Google to create personal or group sites equipped with features that can support the learning process (Taufik, 2018). Based on the description above, the purpose of this

study was to describe the practicality of the physics learning device with the guided inquiry model using Google's sites media. This research has the benefit of providing learning information quickly and can be accessed anywhere and anytime.

Method

This research is included in research and development type research and development (R&D) research, that is, development type research that focuses on describing the degree of practical application of physics learning devices using the guided inquiry model using Google sites media. This study uses the ADDIE model development, which consists of the analysis, design, development, implementation, and evaluation stages.

Conduct practicality tests of learning tools at the implementation stage to confirm the practicality of learning with the developed learning tools. It will be implemented in class XI IPA of SMA Negeri 1 Tilango for Odd Quarters of the 2022/2023 Academic Year in Determining Research Topics Using Simple Sampling Methods. The usefulness of the learning device is reflected in the observation of learning performance and teacher and student reactions to the developed learning materials. The data collection tool is an observation sheet of the lesson plan-based learning implementation at each meeting. The assessment on the learning implementation sheet consists of two options: implemented and not implemented. Assessment of learning performance is done by testing the average total score results given in Table 1 (Purnomo, 2014:92).

Table 1. Learning Implementation Criteria

Value (%)	Criteria
81 - 100	Very good
61 - 80	Good
41 - 60	Enough
21 - 40	Not good

The practicality of learning is also seen by giving questionnaires to the responses of teachers and students to learn using the developed tools. In this study, the response questionnaire instrument used a Likert scale, and respondents gave a score of 1 (strongly disagree), 2 (disagree), 3 (doubtful), 4 (agree), and 5 (strongly agree).

Result and Discussion

The practicality of the developed learning tools can be seen from the learning activity guidelines and step-by-step implementation sheets included in the lesson plan and from the responses to questionnaires

from teachers and students. The activity of learning model implementation can be seen in Figure 1.

Figure 1. The activity of learning model implementation

Results

The practicality of the developed learning tool can be confirmed from the implementation sheet that traces the steps of the learning activities included in the three

lesson plans. The percentage of learning practice sheets shows in Table 2.

Table 2. Results of Implementation of Learning

Meeting	Article Error	Percentage of Implementation (%)	Criteria
1.		91.6	Very good
2.		100	Very good
3.		100	Very good
Average		91.2	Very good

Table 2 shows the learning implementation percentage for the three meetings reached very good criteria. It can be seen that the learning implementation from the first to the third meeting has an overall average score of 91.2% and obtains very good criteria according to (Durnomo, 2014).

The practicality of the developed learning tools was also evident from questionnaires given by teachers and students. A teacher response questionnaire was issued after the three sessions of the learning process to check teachers' responses to the learning tools used. The teacher response questionnaire can be seen in Table 3.

Table 3. Results of the Teacher Response Questionnaire

Indicator	Article Error	Strongly agree	Agree	Doubtful	Disagree	Strongly Disagree
Syllabus		50	50	0	0	0
Lesson plan		37.14	62.86	0	0	0
Student worksheets		71.42	28.57	0	0	0
Teaching materials		58.33	41.67	0	0	0
Media		63.64	36.36	0	0	0
Learning outcomes test		52.63	47.37	0	0	0
Average		55.52	44.48	0	0	0

Based on Table 3, The results of the teacher response questionnaire showed that the teachers' responses to the six learning device assessment indicators reached 55.52% strongly agree, and 44.48% agreed on all components of the learning device developed. This indicates that the physics

teacher's response to the developed learning tool met the appropriate criteria for its use in learning.

After the learning process, student response questionnaire sheets were given for three meetings to see student responses to the learning tools developed. The results of student response data are presented in Table 4.

Table 4. Student Response Questionnaire Results

Indicator	Article Error	Strongly agree	Agree	Doubtful	Disagree	Strongly Disagree
Syllabus		20.8	68.8	10.4	0	0
Lesson plan		21.33	70.66	8	0	0
Student worksheets		26.66	64	9.33	0	0
Teaching materials		29.33	54.66	16	0	0
Media		22.66	57.33	20	0	0
Learning outcomes test		51.2	68.8	10.4	0	0
Average		25.04	64.04	12.35	0	0

Table 4 shows that the developed learning tools meet the requirements for use in the learning process, with an average response of students reaching 25.04% strongly agree, 64.04%, and 12.35% respond hesitantly.

Discussion

The learning tool practicality can be seen in the learning implementation, teacher and student response questionnaires. Observers observed the implementation of learning in three sessions. Based on observer observations of teacher-implemented learning, the learning delivery follows the learning stages set out in the lesson plan of the first meeting, namely 91.6%; this was because the teacher did not carry out the two steps of the activities listed in the lesson plan. At the second meeting, it was 100% implemented, and in the third meeting was 100%, so the average percentage of learning implementation was 91.2%, thus obtaining a very good and practical title to be implemented in the learning process. This is consistent with research conducted by (Benda, Dewi & Trisnawaty, 2022), which states that the implementation of learning by conformity with the steps contained in lesson plans obtains an average percentage of learning implementation for three meetings of 98.33%. Get the title of very good and practical to be implemented in learning.

The learning devices practicality is also reviewed from the response of teachers and students. The teacher's response questionnaire consisting of 6 indicators consisting of 116 statements showed that, on average, teachers agreed to implement the guided inquiry learning model using Google sites media. At the same time, the student questionnaire showed that most students agreed to implement the guided inquiry learning model using Google sites media. Thus, results from the average percentage of teacher and student responses on learning tools are expanded into practical categories that can be applied to the learning process. This aligns with research conducted (Chairunnisa, 2022) that practical learning tools can help teachers implement the learning process. This research is also supported by (Sabrina, 2019), which shows that using google sites-based learning media is an innovative and interactive learning media creation in learning.

Conclusion

Based on the research and discussion results, the guided inquiry learning device using google sites media on static fluid material is practical to implement in physics learning. Results from the average percentage of teacher and student responses on learning tools are expanded into practical categories that can be applied to the learning process. Some things that can be used in

suggestions for further improvement, namely for future researchers to develop learning tools in other physics materials.

Abstract: This study aimed to describe the practicality of physics learning devices with guided inquiry learning models using google site media. This research was conducted at SMAN 1 Tilango, and the study sample was class XI IPA, using a simple random sampling technique. This development study uses research and development research (R&D) using the developed ADDIE development model. It will be implemented in class XI IPA of SMA Negeri 1 Tilango for odd quarters of the 2022/2023 Academic Year in determining research topics using simple sampling methods. The results showed that the guided inquiry learning model with google sites media on static fluid material was very well used in the learning process, with an average percentage of learning implementation of 91.2%, an average student response of 83.6%, and an average response of teachers by 92.03%. Results from the average percentage of teacher and student responses on learning tools are expanded into practical categories that can be applied to the learning process.

Keywords: Google sites; Guided inquiry; Learning device; Static fluid.

Introduction

Education is an organized communication designed to develop learning activities for learners or students. In education, a trendy term is known, namely the teaching and learning or learning process. Learning is an attempt to guide the student through the learning process to obtain learning objectives following what is expected (Payu et al., 2023; Amali et al., 2023; Hermanto et al., 2023; Djou et al., 2022).

The education curriculum, especially in Indonesia, is multiplying. The curriculum in Indonesia constantly changes according to the times, science and technology, students' intelligence level, and society's needs. Based on the revised 2013 curriculum, education enables Indonesian people to be loyal, productive, innovative, creative, and effective. Contributing to society, nation, nation and national life. It is intended to prepare you for life as an individual and citizen. A

country that contributes to world civilization. For this to be achieved, the 2013 Curriculum Education Program should be a reference for classroom learning implementation. Physics is one of the basic sciences dealing with nature, behavior, and the structure of things (Ntobuo et al., 2023; Abdjul et al., 2022). Physics is a branch of science that requires not only theories and formulas that need to be memorized but also understanding and comprehension of concepts that focus on knowledge formation through the discovery and presentation of data. (Mahardika et al., 2021). Quality learning requires learning tools that can support students in understanding and mastering the material well (Gunada et al., 2015; Bokingo et al., 2022).

The teacher arranges learning tools so that the implementation of learning goes well according to what was previously planned. It motivates students to learn and makes understanding the material the teacher presents easier (Saputri et al., 2022; Pakaya et

How to Cite:

Example: Supartin, Buhungo, T. J., Arbie, A., Sanjaya, F., & Demulawa, M. (2023). Practicality of guided inquiry learning devices using google sites media on static fluid materials. *Jurnal Penelitian Pendidikan IPA*, 1(1), 1-4. <https://doi.org/10.29303/jppipa.v1i1.264>

al., 2022). The learning tools usually developed are syllabi, teaching materials, worksheets, learning media, lesson plans, and assessment tests (Sahidu, 2019; Buhungo et al., 2023).

Based on activities about interviews and observations with teachers at SMAN 1 Tilango, especially physics teachers, they have used learning tools guided by the 2013 curriculum, which consists of a syllabus, student worksheets, lesson plans, teaching materials, learning media, and evaluation instruments. Nevertheless, in its application, learning still runs in one direction or is only centered on the teacher's need for more innovative use of learning models. Teachers tend to use the lecture method to make students more likely to be passive. In addition, the need for further innovation in the use of learning media is suboptimal, especially the use of learning media that utilizes technology. This causes a lack of interest in students, and students need to understand the physics concepts being taught. This is evident when looking at the student population who get scores above the minimum completeness criteria of only 30%.

There needs to be innovation in learning physics to improve the learning process in Responding to these problems. One effort to overcome this is to develop learning tools. Learning devices are a collection of tools teachers and students use in the learning process so that the teaching and learning process can run smoothly, efficiently, and effectively (Trianto, 2018; Linggile et al., 2022). The learning process can run effectively and is heavily influenced by learning tools, so it is necessary to develop learning tools. An appropriate learning model is needed to encourage students to learn actively. To support this, one model that emphasizes student activity is the guided inquiry model (Suhartini et al., 2016; Alik et al., 2023).

The guided inquiry learning model is a learning model that shows students to find answers to problems posed by teachers (Amam., 2015). The advantage of the guided inquiry model, according to (Sarwi et al., 2016; Setiawan et al., 2023), namely the observation process can create exciting and fun learning conditions so that students are more motivated to learn. The selection of the guided inquiry learning model is supported by research results (Hermansyah et al., 2017; Supartin et al., 2022), which show that guided inquiry learning affects mastery of concepts. Along with the development of information technology, it is necessary to use technology as a medium that supports the learning process, one of which is the use of Google sites media. Google sites are products made by Google to create personal or group sites equipped with features that can support the learning process (Taufik, 2018). Based on the description above, the purpose of this

study was to describe the practicality of the physics learning device with the guided inquiry model using Google's sites media. This research has the benefit of providing learning information quickly and can be accessed anywhere and anytime.

Method

This research is included in research and development type research and development (R&D) research, that is, development type research that focuses on describing the degree of practical application of physics learning devices using the guided inquiry model using Google sites media. This study uses the ADDIE model development, which consists of the analysis, design, development, implementation, and evaluation stages.

Conduct practicality tests of learning tools at the implementation stage to confirm the practicality of learning with the developed learning tools. It will be implemented in class XI IPA of SMA Negeri 1 Tilango for odd quarters of the 2022/2023 Academic Year in determining research topics using simple sampling methods. The usefulness of the learning device is reflected in the observation of learning performance and teacher and student reactions to the developed learning materials. The data collection tool is an observation sheet of the lesson plan-based learning implementation at each meeting. The assessment on the learning implementation sheet consists of two options: implemented and not implemented. Assessment of learning performance is done by testing the average total score results given in Table 1 (Purnomo, 2014).

Table 1. Learning Implementation Criteria

Value (%)	Criteria
81 - 100	Very good
61 - 80	Good
41 - 60	Enough
21 - 40	Not good

The practicality of learning is also seen by giving questionnaires to the responses of teachers and students to learn using the developed tools. In this study, the response questionnaire instrument used a Likert scale, and respondents gave a score of 1 (strongly disagree), 2 (disagree), 3 (doubtful), 4 (agree), and 5 (strongly agree).

Result and Discussion

The practicality of the developed learning tools can be seen from the learning activity guidelines and step-by-step implementation sheets included in the lesson plan and from the responses to questionnaires

from teachers and students. The activity of learning model implementation can be seen in Figure 1.

Figure 1. The activity of learning model implementation

Results

The practicality of the developed learning tool can be confirmed from the implementation sheet that traces the steps of the learning activities included in the three

lesson plans. The percentage of learning practice sheets shows in Table 2.

Table 2. Results of Implementation of Learning

Meeting	Percentage of Implementation (%)	Criteria
1.	91.6	Very good
2.	100	Very good
3.	100	Very good
Average	91.2	Very good

Table 2 shows the learning implementation percentage for the three meetings reached very good criteria. It can be seen that the learning implementation from the first to the third meeting has an overall average score of 91.2% and obtains very good criteria according to (Purnomo, 2014).

The practicality of the developed learning tools was also evident from questionnaires given by teachers and students. A teacher response questionnaire was issued after the three sessions of the learning process to check teachers' responses to the learning tools used. The teacher response questionnaire can be seen in Table 3.

Table 3. Results of the Teacher Response Questionnaire

Indicator	Strongly agree	Agree	Doubtful	Disagree	Strongly Disagree
Syllabus	50	50	0	0	0
Lesson plan	37.14	62.86	0	0	0
Student worksheets	71.42	28.57	0	0	0
Teaching materials	58.33	41.67	0	0	0
Media	63.64	36.36	0	0	0
Learning outcomes test	52.63	47.37	0	0	0
Average	55.52	44.48	0	0	0

Based on Table 3, The results of the teacher response questionnaire showed that the teachers' responses to the six learning device assessment indicators reached 55.52% strongly agree, and 44.48% agreed on all components of the learning device developed. This indicates that the physics

teacher's response to the developed learning tool met the appropriate criteria for its use in learning.

After the learning process, student response questionnaire sheets were given for three meetings to see student responses to the learning tools developed. The results of student response data are presented in Table 4.

Table 4. Student Response Questionnaire Results

Indicator	Strongly agree	Agree	Doubtful	Disagree	Strongly Disagree
Syllabus	20.8	68.8	10.4	0	0
Lesson plan	21.33	70.66	8	0	0
Student worksheets	26.66	64	9.33	0	0
Teaching materials	29.33	54.66	16	0	0
Media	22.66	57.33	20	0	0
Learning outcomes test	51.2	68.8	10.4	0	0
Average	25.04	64.04	12.35	0	0

Table 4 shows that the developed learning tools meet the requirements for use in the learning process, with an average response of students reaching 25.04% strongly agree, 64.04%, and 12.35% respond hesitantly.

Discussion

The learning tool practicality can be seen in the learning implementation, teacher and student response questionnaires. Observers observed the implementation of learning in three sessions. Based on observer observations of teacher-implemented learning, the learning delivery follows the learning stages set out in the lesson plan of the first meeting, namely 91.6%; this was because the teacher did not carry out the two steps of the activities listed in the lesson plan. At the second meeting, it was 100% implemented, and in the third meeting was 100%, so the average percentage of learning implementation was 91.2%, thus obtaining a very good and practical title to be implemented in the learning process. This is consistent with research conducted by (Ali et al., 2022), which states that the implementation of learning by conformity with the steps contained in lesson plans obtains an average percentage of learning implementation for three meetings of 98.33%. Get the title of very good and practical to be implemented in learning.

The learning devices practicality is also reviewed from the response of teachers and students. The teacher's response questionnaire consisting of 6 indicators consisting of 116 statements showed that, on average, teachers agreed to implement the guided inquiry learning model using Google sites media. At the same time, the student questionnaire showed that most students agreed to implement the guided inquiry learning model using Google sites media. Thus, results from the average percentage of teacher and student responses on learning tools are expanded into practical categories that can be applied to the learning process. This aligns with research conducted (Chairunnisa, 2022) that practical learning tools can help teachers implement the learning process. This research is also supported by (Sabrina, 2019), which shows that using google sites-based learning media is an innovative and interactive learning media creation in learning.

Conclusion

Based on the research and discussion results, the guided inquiry learning device using google sites media on static fluid material is practical to implement in physics learning. Results from the average percentage of teacher and student responses on learning tools are expanded into practical categories that can be applied to the learning process. Some things that can be used in

suggestions for further improvement, namely for future researchers to develop learning tools in other physics materials.

Abstract: This study aimed to describe the practicality of physics learning devices with guided inquiry learning models using google site media. This research was conducted at SMAN 1 Tilango, and the study sample was class XI IPA, using a simple random sampling technique. This development study uses research and development research (R&D) using the developed ADDIE development model. It will be implemented in class XI IPA of SMA Negeri 1 Tilango for odd quarters of the 2022/2023 Academic Year in determining research topics using simple sampling methods. The results showed that the guided inquiry learning model with google sites media on static fluid material was very well used in the learning process, with an average percentage of learning implementation of 91.2%, an average student response of 83.6%, and an average response of teachers by 92.03%. Results from the average percentage of teacher and student responses on learning tools are expanded into practical categories that can be applied to the learning process.

Keywords: Google sites; Guided inquiry; Learning device; Static fluid

Introduction

Education is an organized communication designed to develop learning activities for learners or students. In education, a trendy term is known, namely the teaching and learning or learning process. Learning is an attempt to guide the student through the learning process to obtain learning objectives following what is expected (Amali et al., 2023; Djou et al., 2022; Hermanto et al., 2023; Payu et al., 2023).

The education curriculum, especially in Indonesia, is multiplying. The curriculum in Indonesia constantly changes according to the times, science and technology, students' intelligence level, and society's needs. Based on the revised 2013 curriculum, education enables Indonesian people to be loyal, productive, innovative, creative, and effective. Contributing to society, nation, and national life. It is intended to prepare you for life as an individual and citizen. A country that contributes to world civilization. For this to be achieved, the 2013 Curriculum Education Program should be a reference for classroom learning implementation. Physics is one of the basic sciences dealing with nature, behavior, and the structure of

things (Abdjul et al., 2022; Ntobuo et al., 2023). Physics is a branch of science that requires not only theories and formulas that need to be memorized but also understanding and comprehension of concepts that focus on knowledge formation through the discovery and presentation of data (Mahardika et al., 2012). Quality learning requires learning tools that can support students in understanding and mastering the material well (Bokingo et al., 2022; Gunada et al., 2017).

The teacher arranges learning tools so that the implementation of learning goes well according to what was previously planned. It motivates students to learn and makes understanding the material the teacher presents easier (Pakaya et al., 2022; Saputri et al., 2022). The learning tools usually developed are syllabi, teaching materials, worksheets, learning media, lesson plans, and assessment tests (Buhungo et al., 2023; Sahidu, 2019).

Based on activities about interviews and observations with teachers at SMAN 1 Tilango, especially physics teachers, they have used learning tools guided by the 2013 curriculum, which consists of a syllabus, student worksheets, lesson plans, teaching materials, learning media, and evaluation instruments.

Nevertheless, in its application, learning still runs in one direction or is only centered on the teacher's need for more innovative use of learning models. Teachers tend to use the lecture method to make students more likely to be passive. In addition, the need for further innovation in the use of learning media is suboptimal, especially the use of learning media that utilizes technology. This causes a lack of interest in students, and students need to understand the physics concepts being taught. This is evident when looking at the student population who get scores above the minimum completeness criteria of only 30%.

There needs to be innovation in learning physics to improve the learning process in Responding to these problems. One effort to overcome this is to develop learning tools. Learning devices are a collection of tools teachers and students use in the learning process so that the teaching and learning process can run smoothly, efficiently, and effectively (Linggile et al., 2022; Trianto, 2018). The learning process can run effectively and is heavily influenced by learning tools, so it is necessary to develop learning tools. An appropriate learning model is needed to encourage students to learn actively. To support this, one model that emphasizes student activity is the guided inquiry model (Alik et al., 2023; Suhartini et al., 2017).

The guided inquiry learning model is a learning model that shows students to find answers to problems posed by teachers (Annam, 2015). The advantage of the guided inquiry model, according to Sarwi et al. (2016) and Setiawan et al. (2023), namely the observation process can create exciting and fun learning conditions so that students are more motivated to learn. The selection of the guided inquiry learning model is supported by research results Hermansyah et al. (2017) and Supartin et al. (2022), which show that guided inquiry learning affects mastery of concepts. Along with the development of information technology, it is necessary to use technology as a medium that supports the learning process, one of which is the use of Google sites media. Google sites are products made by Google to create personal or group sites equipped with features that can support the learning process (Taufik et al., 2018). Based on the description above, the purpose of this study was to describe the practicality of the physics learning device with the guided inquiry model using Google's sites media. This research has the benefit of providing learning information quickly and can be accessed anywhere and anytime.

Method

This research is included in research and development type research and development (R&D) research, that is, development type research that focuses on describing the degree of practical

application of physics learning devices using the guided inquiry model using Google sites media. This study uses the ADDIE model development, which consists of the analysis, design, development, implementation, and evaluation stages.

Conduct practicality tests of learning tools at the implementation stage to confirm the practicality of learning with the developed learning tools. It will be implemented in class XI IPA of SMA Negeri 1 Tilango for odd quarters of the 2022/2023 Academic Year in determining research topics using simple sampling methods. The usefulness of the learning device is reflected in the observation of learning performance and teacher and student reactions to the developed learning materials. The data collection tool is an observation sheet of the lesson plan-based learning implementation at each meeting. The assessment on the learning implementation sheet consists of two options: implemented and not implemented. Assessment of learning performance is done by testing the average total score results given in Table 1 (Purnomo, 2017).

Table 1. Learning Implementation Criteria

Value (%)	Criteria
81 - 100	Very good
61 - 80	Good
41 - 60	Enough
21 - 40	Not good

The practicality of learning is also seen by giving questionnaires to the responses of teachers and students to learn using the developed tools. In this study, the response questionnaire instrument used a Likert scale, and respondents gave a score of 1 (strongly disagree), 2 (disagree), 3 (doubtful), 4 (agree), and 5 (strongly agree).

Result and Discussion

The practicality of the developed learning tools can be seen from the learning activity guidelines and step-by-step implementation sheets included in the lesson plan and from the responses to questionnaires from teachers and students. The activity of learning model implementation can be seen in Figure 1.

Figure 1. The activity of learning model implementation

Results

The practicality of the developed learning tool can be confirmed from the implementation sheet that traces the steps of the learning activities included in the three lesson plans. The percentage of learning practice sheets shows in Table 2.

Table 2. Results of Implementation of Learning

Meeting	Percentage of Implementation (%)	Criteria
1.	91.6	Very good
2.	100	Very good
3.	100	Very good
Average	91.2	Very good

Table 2 shows the learning implementation percentage for the three meetings reached very good criteria. It can be seen that the learning implementation from the first to the third meeting has an overall average score of 91.2% and obtains very good criteria according to (Purnomo, 2017).

The practicality of the developed learning tools was also evident from questionnaires given by teachers and students. A teacher response questionnaire was issued after the three sessions of the learning process to check teachers' responses to the learning tools used. The teacher response questionnaire can be seen in Table 3.

Table 3. Results of the Teacher Response Questionnaire

Indicator	Strongly agree	Agree	Doubtful	Disagree	Strongly Disagree
Syllabus	50	50	0	0	0
Lesson plan	37.14	62.86	0	0	0
Student worksheets	71.42	28.57	0	0	0
Teaching materials	58.33	41.67	0	0	0
Media	63.64	36.36	0	0	0
Learning outcomes test	52.63	47.37	0	0	0
Average	55.52	44.48	0	0	0

Table 4. Student Response Questionnaire Results

Indicator	Strongly agree	Agree	Doubtful	Disagree	Strongly Disagree
Syllabus	20.8	68.8	10.4	0	0
Lesson plan	21.33	70.66	8	0	0
Student worksheets	26.66	64	9.33	0	0
Teaching materials	29.33	54.66	16	0	0
Media	22.66	57.33	20	0	0
Learning outcomes test	51.2	68.8	10.4	0	0
Average	25.04	64.04	12.35	0	0

Based on Table 3, the results of the teacher response questionnaire showed that the teachers' responses to the six learning device assessment indicators reached 55.52% strongly agree, and 44.48% agreed on all components of the learning device developed. This indicates that the physics teacher's response to the developed learning tool met the appropriate criteria for its use in learning.

After the learning process, student response questionnaire sheets were given for three meetings to see student responses to the learning tools developed. The results of student response data are presented in Table 4.

Table 4 shows that the developed learning tools meet the requirements for use in the learning process, with an average response of students reaching 25.04% strongly agree, 64.04%, and 12.35% respond hesitantly.

Discussion

The learning tool practicality can be seen in the learning implementation, teacher and student response questionnaires. Observers observed the implementation of learning in three sessions. Based on observer observations of teacher-implemented learning, the learning delivery follows the learning stages set out in the lesson plan of the first meeting,

namely 91.6%, this was because the teacher did not carry out the two steps of the activities listed in the lesson plan. At the second meeting, it was 100% implemented, and in the third meeting was 100%, so the average percentage of learning implementation was 91.2%, thus obtaining a very good and practical title to be implemented in the learning process. This is consistent with research conducted by Benda et al. (2022), which states that the implementation of learning by conformity with the steps contained in lesson plans obtains an average percentage of learning implementation for three meetings of 98.33%. Get the title of very good and practical to be implemented in learning.

The learning devices practicality is also reviewed from the response of teachers and students. The teacher's response questionnaire consisting of 6 indicators consisting of 116 statements showed that, on average, teachers agreed to implement the guided inquiry learning model using Google sites media. At the same time, the student questionnaire showed that most students agreed to implement the guided inquiry learning model using Google sites media. Thus, results from the average percentage of teacher and student

responses on learning tools are expanded into practical categories that can be applied to the learning process. This aligns with research conducted (Chairunnisa et al., 2022) that practical learning tools can help teachers implement the learning process. This research is also supported by Shabrina et al. (2019), which shows that using google sites-based learning media is an innovative and interactive learning media creation in learning.

Conclusion

Based on the research and discussion results, the guided inquiry learning device using google sites media on static fluid material is practical to implement in physics learning. Results from the average percentage of teacher and student responses on learning tools are expanded into practical categories that can be applied to the learning process. Some things that can be used in suggestions for further improvement, namely for future researchers to develop learning tools in other physics materials.
