Karaterisasi Flavonoid dari Daun Min (*Melia azedarach*)

Suryelita (174-182)

Indeks Kematangan Gonad Ikan Nila (*Oreochromis niloticus L*)

Yang diberi Pakan Alternatif Dan Dipotong Sirip Ekornya

Margaretha Solang (183-193)

Menyelesaikan Persamaan Diferensial Osilator Non Linear dengan
Metode Krylov –Bogoliubov

Nursiya Bito (194-206)

Pengaruh Kerapatan Sampel Campuran Sekam dan Dedak pada

Koefisien Refleksi dan Koefisien Transmisi Gelombang Kustik

Tirtawaty Abdjul (207-220)

Analisis *Edit Distance* Menggunakan algoritma *Dynamic Programming*

Arip Mulyanto (221-236)

Polymerase Chain Reaction (PCR)

Zuhriana K.Yusuf (237-244)

Pengaruh Ekstrak Daun Sukun (*Arthocarpus communis*)

Terhadap Fertilitas Mencit (*Mus musculus*) ICR Jantan

Ekawaty Prasetya (245-256)

Pengaruh Pemberian Tepung Ikan Payangka (*Ophieleotris Aporos*)

Terhadap Kadar Kalsium Tulang Tikus Putih (*Rattus Norvegicus Strain Wistar*)

M. Anas Anasiru (257-270)

Bibilo Dan Pengaruhnya Terhadap Ekosistem Perairan Danau Limboto

Chairunnisa J.Lamangantjo (271-279)

Regresi Logistik untuk Data Ordinal

Dewi Rahmawaty Isa (280-288)

Trend Dinamika Kependudukan Provinsi Gorontalo

Herlina Jussuf (289-304)

NYELESAIKAN PERSAMAAN DIFERENSIAL OSILATOR LINEAR DENGAN METODE KRYLOV –BOGOLIUBOV

Nursiya Bito

Staf Dosen Jurusan Pendidikan Matematika FMIPA
Universitas Negeri Gorontalo

ABSTRACT

During a century and half of development and refinement of techniques, calculus consisted of these paired operations and their applications, primarily to physical problems. Newton's theory of "fluxions", which was based on an intuitive idea of limit, would be familiar to any modern student of differential calculus once some changes in terminology and notation were made. But the vital observation, made by Newton and, independently, by Gottfried Leibniz, was that areas under curves could be calculated by reversing the differentiation process. The exciting technique, one that solved previously difficult area problems with ease, sparked enormous interest among the mathematicians of the era and led to a coherent theory that became known as the differential and integral calculus.

This paper will develop the theory of differentiation. We will assume that the reader is already familiar with the physical interpretations of derivative of a function as described in introductory calculus courses. Consequently, we will concentrate on the mathematical aspects of the derivative and the applications in physics. The first section is devoted to a presentation of the basic form of non-linear differential equations. A discussion of Krylov-Bogoliubov Method is also given. The material is of the greatest importance because this method can determine solution of non-linear differential equations.

Keywords : Persamaan Diferensial Non Linear, Krylov –Bogoliubov

DAHULUAN

Sepanjang sejarah matematika terapan, metode pendekatan untuk persamaan diferensial telah memperoleh perhatian yang besar. Dewasa ini telah dikembangkan suatu metode pendekatan pada pemilihan suatu deret fungsi-fungsi baku dengan
